

■ PathFinder AI

Making Indoor Navigation Smarter with Google Gemini

■ Introduction

Have you ever entered a large hospital and spent 20 minutes looking for the billing counter? Or rushed through an unfamiliar railway station trying to find the right platform?

This problem inspired me to build **PathFinder AI**, an AI-powered indoor navigation assistant.

■ The Problem

Every day, thousands of people get lost inside:

- Hospitals
- Colleges
- Airports
- Railway Stations
- Shopping Malls

People waste time searching for:

- Administration Office
- Washroom
- Medical Center
- Ticket Counter

■ *Illustration of someone looking confused in a large building — insert image here*

■ The Solution

PathFinder AI helps users find indoor destinations using natural language. Instead of searching manually, users can simply say:

"Take me to the Accounts Office."

The AI understands the request and guides the user with simple directions.

■ How Google AI Helps

- **Gemini API** understands user requests.
- **Voice input** lets users speak naturally.
- **Multilingual support** helps more people.

System Architecture

Features

- Voice search
- Indoor routing
- Landmark-based directions
- Accessibility options
- Multilingual support

Add screenshots for each feature.

Challenges

[Describe any difficulties you faced and how you solved them.]

Future Improvements

- AR navigation
- Camera-based positioning
- Support for more buildings

■ Conclusion

[Summarize your vision and what you hope the project can achieve.]
